Please attempt to determine a Lat / Long for the contact at initial detection. We recommend using JMPS to reference the sensor-derived bearing and range relative to the bullseye you had in use. If that method is not available, any reasonable derivation of location will work, but please be as specific as possible and make a note in the comments section. These locations may be used to cue other means of tracking.

Was the contact moving? Yes

Please use the field below to describe the contact and any interaction in your own words with as much detail as possible. Please be sure to include any detail not included in questions above.

While performing an ISR tasking (ULTN/Black Hot/Lin), a solid white object flew through the FOV. There was a temporarily lose of the object but re-acquired shortly there after. The crew was able to follow the object as it appeared to make erratic moments above the water. During the follow, crew was able to obtain 4x zoom on the object but lost the object due to poor track placement. While following, the sensor operator was continuously manipulating the sensor to maintain eyes on the object. This is apparent by the waves of the water in the background being visible and not being visible.

Don't use the purple "submit" button! Save this form with filename "**Date_Squadron_RF.pdf**" and email it to (Also in the global). For troubleshooting, call

Thank you for your time. Please ensure all display tapes are ripped for the entire time of interaction and saved as a .wmv (Example: 4 May VFA-106 HUD.wmv). Squadron intel personnel shall upload those files to the repository located at [this link](#).
