Multiple Unidentified Aerial Phenomenon

Observed Maneuvering Erratically and In Formation Over Gulf of Oman During AC-130 Gunship Live Fire Training on 8 September 2021 - Attachment

SUMMARY:

On 8 September 2021 a USSOF AC-130 Gunship observed approximately 25 instances of UAPs while conducting a live fire exercise in the Gulf of Oman. The UAPs were observed as cold orbs flying at lower altitudes between 250 to 1300 MPH in different formations as well as maneuvering aggressively. UAPs also appeared to react to the aircraft firing its main cannon.

MESSAGE:

[REDACTED] INITIAL OBSERVATION. On 8 September 2021 a United States Special Operations Forces (USSOF) AC-130 Gunship was conducting live fire training the Gulf of Oman in the vicinity of (VO) //MGRS: 40REN681 431 31 43// during period of darkness. The AC-130 first observed Unidentified Aerial Phenomenon (UAPs) when the aircraft dropped a water-activated flare to use as a mock target. The AC-130 entered an orbit around the flare and the Combat Systems Officer (CSO) conducted collateral scans with the aircraft's Electro Optical/Infrared (EO/IR) sensor IVO the flare. When the CSO slewed the sensor in IR mode back to the flare they observed two approximately four-foot diameter cold orbs between 0 to 20 feet above the surface of the water stationary over the flare for approximately 15 seconds. After those 15 seconds passed, the CSO pulled the trigger firing the aircraft's 105mm cannon. Immediately upon pulling the trigger, during the slight delay between trigger pull and the cannon's recoil, the CSO observed the pair of UAPs rapidly fly away from the flare and out of the sensor feed without changing altitude.

[REDACTED] SUBSEQUENT OBSERVATIONS. The AC-130 crew observed approximately 25 instances of UAPs viewed in IR as cold orbs in both white-is-hot and black-is-hot mode during the sortie. Two UAPs were observed flying in a loose but coordinated formation increasing and decreasing altitude like a wave while maneuvering around, over, and under each other in a manner similar to how dolphins playfully swim in a pod. (SOURCE COMMENT: They [The UAPs] knew they were flying together). UAPs were also separately observed flying in a formation of three and separately observed flying erratically and maneuvering aggressively. The attached videos depict a smoothly slewing EO/IR sensor or a stationary EO/IR sensor with multiple UAPs darting around the sensor feed. The AC-130's crew attempted to save entirety of the EO/IR footage of the UAP observations but the aircraft's Digital Video Recorder (DVR) inexplicably failed and the video data became corrupted.

[REDACTED] ESTIMATED SPEED. The CSO calculated the UAP's approximate speeds using the aircraft's TACTOOL and clocked their maximum observed maneuvering speed at 1300 miles per hour (MPH) and the UAPs minimum observed maneuvering speed at 250 MPH. No means of propulsion were observed.

COMMENT:

[REDACTED] 1.4c is the tag line for AFSOC personnel conducting [REDACTED] 1.4c debriefing.

(U// [REDACTED] This IIR was coordinated with USDAO Muscat and SOCCENT J2X without comment.

(U) Source A is available for recontact about information in this report.

(U// [REDACTED] Geographic coordinates were derived from AC-130 sensor feed GPS data.

(U// [REDACTED] requests concerning foreign disclosure and release of the information contained in this report should be sent to the AFSOC FDO at [REDACTED] 3.5c, (b)(6)

Include the justification, serial number, subject line of the report and the proposed request in the initial correspondence.

(U// [REDACTED] IIR Evaluations and Source Directed Requirements regarding this report are highly encouraged to assist in assessing collection efforts and requirements. Evaluations and Source Directed Requirements can be created using [REDACTED] 1.4(c)
